

Fun with Science

3D Dry Erase People

Things you will need:

- Glass plate or bowl
- Dry erase marker
- Water

Instructions:

Draw a person on the glass plate using the dry erase marker. Then slowly pour water onto the plate and it will lift the picture off the plate as though it is floating on the water.

The science behind it:

The dry erase marker is made using a mixture of pigments and ethyl alcohol. When you pour water onto the ink, the alcohol dissolves leaving behind only the pigments. The pigments then become solid and the glass is so smooth that it just slides right off and floats.
